

Relational Algebra

CS 186 Fall 2012
R & G, Chapter 4

By relieving the brain of all unnecessary work, a good notation sets it free to concentrate on more advanced problems, and, in effect, *increases the mental power of the race.*

-- Alfred North Whitehead (1861 - 1947)

Relational Query Languages

- **Query languages**: Allow manipulation and **retrieval of data** from a database.
- **Relational model supports simple, powerful QLs**:
 - Strong formal foundation based on logic.
 - Allows for much optimization.
- **Query Languages \neq programming languages!**
 - QLs not expected to be “Turing complete”.
 - QLs not intended to be used for complex calculations.
 - QLs support easy, efficient access to large data sets.

Formal Relational Query Languages

Two mathematical Query Languages form the basis for “real” languages (e.g. SQL), and for implementation:

Relational Algebra: More **operational**, very useful for representing execution plans.

Relational Calculus: Lets users describe what they want, rather than how to compute it.
(**Non-procedural**, **declarative**.)

✉ *Understanding Algebra (and Calculus) is key to understanding SQL, query processing!*

Preliminaries

- A query is applied to *relation instances*, and the result of a query is also a relation instance.
 - *Schemas of input* relations for a query are *fixed* (but query will run over any legal instance)
 - The *schema for the result* of a given query is *fixed*.
 - It is determined by the definitions of the query language constructs.
- **Positional vs. named-field notation:**
 - Positional notation easier for formal definitions, named-field notation more readable.
 - Both used in SQL

Relational Algebra: 5 Basic Operations

- Selection (σ) Selects a subset of **rows** from relation (horizontal).
- Projection (π) Retains only wanted **columns** from relation (vertical).
- Cross-product (\times) Allows us to combine two relations.
- Set-difference ($-$) Tuples in r_1 , but not in r_2 .
- Union (\cup) Tuples in r_1 and/or in r_2 .

Since each operation returns a relation, **operations can be composed!** (Algebra is “closed”.)

Example Instances $R1$

| <u>sid</u> | <u>bid</u> | <u>day</u> |
|------------|------------|------------|
| 22 | 101 | 10/10/96 |
| 58 | 103 | 11/12/96 |

| <u>bid</u> | bname | color | |
|------------|-----------|-------|--|
| 101 | Interlake | blue | |
| 102 | Interlake | red | |
| 103 | Clipper | green | |
| 104 | Marine | red | |

Boats

$S1$

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 22 | dustin | 7 | 45.0 |
| 31 | lubber | 8 | 55.5 |
| 58 | rusty | 10 | 35.0 |

$S2$

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 28 | yuppy | 9 | 35.0 |
| 31 | lubber | 8 | 55.5 |
| 44 | guppy | 5 | 35.0 |
| 58 | rusty | 10 | 35.0 |

Selection (σ) – Horizontal Restriction

- Selects rows that satisfy *selection condition*.
- Result is a relation.

Schema of result is same as that of the input relation.

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 28 | yuppy | 9 | 35.0 |
| 31 | lubber | 8 | 55.5 |
| 44 | guppy | 5 | 35.0 |
| 58 | rusty | 10 | 35.0 |

(S2)

| <u>sid</u> | sname | rating | age |
|------------|-------|--------|------|
| 28 | yuppy | 9 | 35.0 |
| 58 | rusty | 10 | 35.0 |

$\sigma_{rating > 8}(S2)$

Projection – Vertical Restriction

- Examples: $\pi_{age}(S2)$; $\pi_{sname, rating}(S2)$
- Retains only attributes that are in the “*projection list*”.
- *Schema* of result:
 - exactly the fields in the projection list, with the same names that they had in the input relation.
- Projection operator has to *eliminate duplicates* (How do they arise? Why remove them?)
 - Note: real systems typically don’t do duplicate elimination unless the user explicitly asks for it. (Why not?)

Projection

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 28 | yuppy | 9 | 35.0 |
| 31 | lubber | 8 | 55.5 |
| 44 | guppy | 5 | 35.0 |
| 58 | rusty | 10 | 35.0 |

S2

| sname | rating |
|--------|--------|
| yuppy | 9 |
| lubber | 8 |
| guppy | 5 |
| rusty | 10 |

$\pi_{sname, rating}(S2)$

| age |
|------|
| 35.0 |
| 55.5 |

$\pi_{age}(S2)$

Nesting Operators

- Result of a Relational Algebra Operator is a Relation, so...
- Can use as input to another Relational Algebra Operator

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 28 | yuppy | 9 | 35.0 |
| 31 | lubber | 8 | 55.5 |
| 44 | guppy | 5 | 35.0 |
| 58 | rusty | 10 | 35.0 |

| sname | rating |
|-------|--------|
| yuppy | 9 |
| rusty | 10 |

$$\pi_{sname, rating}(\sigma_{rating > 8}(S2))$$

Union and Set-Difference

- All of these operations take two input relations, which must be **union-compatible**:
 - Same number of fields.
 - ‘Corresponding’ fields have the same type.
- For which, if any, is duplicate elimination required?

Union

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 22 | dustin | 7 | 45.0 |
| 31 | lubber | 8 | 55.5 |
| 58 | rusty | 10 | 35.0 |

S1

| sid | sname | rating | age |
|-----|--------|--------|------|
| 22 | dustin | 7 | 45.0 |
| 31 | lubber | 8 | 55.5 |
| 58 | rusty | 10 | 35.0 |
| 44 | guppy | 5 | 35.0 |
| 28 | yuppy | 9 | 35.0 |

$S1 \cup S2$

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 28 | yuppy | 9 | 35.0 |
| 31 | lubber | 8 | 55.5 |
| 44 | guppy | 5 | 35.0 |
| 58 | rusty | 10 | 35.0 |

S2

Set Difference

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 22 | dustin | 7 | 45.0 |
| 31 | lubber | 8 | 55.5 |
| 58 | rusty | 10 | 35.0 |

S1

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 28 | yuppy | 9 | 35.0 |
| 31 | lubber | 8 | 55.5 |
| 44 | guppy | 5 | 35.0 |
| 58 | rusty | 10 | 35.0 |

S2

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 22 | dustin | 7 | 45.0 |

$S1 - S2$

| <u>sid</u> | sname | rating | age |
|------------|-------|--------|------|
| 28 | yuppy | 9 | 35.0 |
| 44 | guppy | 5 | 35.0 |

$S2 - S1$

Cross-Product

- $S1 \times R1$: Each row of $S1$ paired with each row of $R1$.
Q: How many rows in the result?
- *Result schema* has one field per field of $S1$ and $R1$, with field names 'inherited' if possible.
 - *May have a naming conflict*: Both $S1$ and $R1$ have a field with the same name.
 - In this case, can use the *renaming operator*:

$$\rho (C(1 \rightarrow sid1, 5 \rightarrow sid2), S1 \times R1)$$

Cross Product Example

| S1 | <u>sid</u> | sname | rating | age |
|----|------------|--------|--------|------|
| | 22 | dustin | 7 | 45.0 |
| | 31 | lubber | 8 | 55.5 |
| | 58 | rusty | 10 | 35.0 |

| R1 | <u>sid</u> | <u>bid</u> | <u>day</u> |
|----|------------|------------|------------|
| | 22 | 101 | 10/10/96 |
| | 58 | 103 | 11/12/96 |

$\rho(C(1 \rightarrow sid1, 5 \rightarrow sid2), S1 \times R1) =$

| <u>sid1</u> | <u>sname</u> | <u>rating</u> | <u>age</u> | <u>sid2</u> | <u>bid</u> | <u>day</u> |
|-------------|--------------|---------------|------------|-------------|------------|------------|
| 22 | dustin | 7 | 45.0 | 22 | 101 | 10/10/96 |
| 22 | dustin | 7 | 45.0 | 58 | 103 | 11/12/96 |
| 31 | lubber | 8 | 55.5 | 22 | 101 | 10/10/96 |
| 31 | lubber | 8 | 55.5 | 58 | 103 | 11/12/96 |
| 58 | rusty | 10 | 35.0 | 22 | 101 | 10/10/96 |
| 58 | rusty | 10 | 35.0 | 58 | 103 | 11/12/96 |

Compound Operator: Intersection

- In addition to the 5 basic operators, there are several additional “Compound Operators”
 - These add no computational power to the language, but are useful shorthands.
 - Can be expressed solely with the basic ops.

Intersection takes two input relations, which must be *union-compatible*.

- Q: How to express it using basic operators?

$$R \cap S = R - (R - S)$$

Intersection

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 22 | dustin | 7 | 45.0 |
| 31 | lubber | 8 | 55.5 |
| 58 | rusty | 10 | 35.0 |

S1

| sid | sname | rating | age |
|-----|--------|--------|------|
| 31 | lubber | 8 | 55.5 |
| 58 | rusty | 10 | 35.0 |

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 28 | yuppy | 9 | 35.0 |
| 31 | lubber | 8 | 55.5 |
| 44 | guppy | 5 | 35.0 |
| 58 | rusty | 10 | 35.0 |

S2

$S1 \cap S2$

Compound Operator: Join (\bowtie)

- Joins are compound operators involving cross product, selection, and (sometimes) projection.
- Most common type of join is a "natural join" (often just called "join"). $R \bowtie S$ conceptually is:
 - Compute $R \times S$
 - Select rows where attributes that appear in both relations have equal values
 - Project all unique attributes and one copy of each of the common ones.
- Note: Usually done much more efficiently than this.
- Useful for putting "normalized" relations back together.

Natural Join Example

| <u>sid</u> | <u>bid</u> | <u>day</u> |
|------------|------------|------------|
| 22 | 101 | 10/10/96 |
| 58 | 103 | 11/12/96 |

R1

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 22 | dustin | 7 | 45.0 |
| 31 | lubber | 8 | 55.5 |
| 58 | rusty | 10 | 35.0 |

S1

R1 ⋈ S1 =

| sid | sname | rating | age | bid | day |
|-----|--------|--------|------|-----|----------|
| 22 | dustin | 7 | 45.0 | 101 | 10/10/96 |
| 58 | rusty | 10 | 35.0 | 103 | 11/12/96 |

Other Types of Joins

- **Condition Join (or "theta-join"):**

$$R \bowtie_c S = \sigma_c (R \times S)$$

- *Result schema* same as that of cross-product.
 - May have fewer tuples than cross-product.
-
- **Equi-Join:** Special case: condition *c* contains only conjunction of *equalities*.

"Theta" Join Example

| <u>sid</u> | <u>bid</u> | <u>day</u> |
|------------|------------|------------|
| 22 | 101 | 10/10/96 |
| 58 | 103 | 11/12/96 |

R1

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 22 | dustin | 7 | 45.0 |
| 31 | lubber | 8 | 55.5 |
| 58 | rusty | 10 | 35.0 |

S1

$$S1 \bowtie_{S1.sid < R1.sid} R1 =$$

| (sid) | sname | rating | age | (sid) | bid | day |
|-------|--------|--------|------|-------|-----|----------|
| 22 | dustin | 7 | 45.0 | 58 | 103 | 11/12/96 |
| 31 | lubber | 8 | 55.5 | 58 | 103 | 11/12/96 |

Compound Operator: Division

- Useful for expressing “for all” queries like:
Find sids of sailors who have reserved all boats.
- For A/B attributes of B are subset of attrs of A .
 - May need to “project” to make this happen.
- E.g., let A have 2 fields, x and y ; B have only field y :

$$A/B = \{ \langle x \rangle \mid \forall \langle y \rangle \in B (\exists \langle x, y \rangle \in A) \}$$

A/B contains all x tuples such that for every y tuple in B , there is an xy tuple in A .

Examples of Division A/B

| sno | pno |
|-----|-----|
| s1 | p1 |
| s1 | p2 |
| s1 | p3 |
| s1 | p4 |
| s2 | p1 |
| s2 | p2 |
| s3 | p2 |
| s4 | p2 |
| s4 | p4 |

A

| pno |
|-----|
| p2 |

B1

| sno |
|-----|
| s1 |
| s2 |
| s3 |
| s4 |

A/B1

| pno |
|-----|
| p2 |
| p4 |

B2

| sno |
|-----|
| s1 |
| s4 |

A/B2

| pno |
|-----|
| p1 |
| p2 |
| p4 |

B3

| sno |
|-----|
| s1 |

A/B3

Note: For relation instances *A* and *B*, *A/B* is the largest relation instance *Q* such that $B \times Q \subseteq A$

Expressing A/B Using Basic Operators

- **Division is not essential op; just a useful shorthand.**
 - (Also true of joins, but joins are so common that systems implement joins specially.)
- **Idea:** For A/B , compute all x values that are not 'disqualified' by some y value in B .
 - x value is *disqualified* if by attaching y value from B , we obtain an xy tuple that is not in A .

Disqualified x values: $\pi_x ((\pi_x(A) \times B) - A)$

A/B : $\pi_x(A) - \text{Disqualified } x \text{ values}$

Examples

Reserves

| <u>sid</u> | <u>bid</u> | <u>day</u> |
|------------|------------|------------|
| 22 | 101 | 10/10/96 |
| 58 | 103 | 11/12/96 |

Sailors

| <u>sid</u> | sname | rating | age |
|------------|--------|--------|------|
| 22 | dustin | 7 | 45.0 |
| 31 | lubber | 8 | 55.5 |
| 58 | rusty | 10 | 35.0 |

Boats

| <u>bid</u> | bname | color | |
|------------|-----------|-------|--|
| 101 | Interlake | Blue | |
| 102 | Interlake | Red | |
| 103 | Clipper | Green | |
| 104 | Marine | Red | |

Find names of sailors who've reserved boat #103

- **Solution 1:** $\pi_{sname}((\sigma_{bid=103} Reserves) \bowtie Sailors)$
- **Solution 2:** $\pi_{sname}(\sigma_{bid=103}(Reserves \bowtie Sailors))$

Find names of sailors who've reserved a red boat

- **Information about boat color only available in Boats; so need an extra join:**

$$\pi_{sname}((\sigma_{color='red'} Boats) \bowtie Reserves \bowtie Sailors)$$

- ❖ A more efficient (???) solution:

$$\rho_{sname}(\rho_{sid}(\rho_{bid}(\sigma_{color='red'} Boats)) \bowtie Res) \bowtie Sailors)$$

✉ A query optimizer can find this given the first solution!

Find names of sailors who've reserved a red or a green boat

- **Can identify all red or green boats, then find sailors who've reserved one of these boats:**

$$\rho \text{ (Tempboats, } (\sigma_{color='red' \vee color='green'} \text{Boats}))$$

$$\pi_{sname}(\text{Tempboats} \bowtie \text{Reserves} \bowtie \text{Sailors})$$

Find sailors who've reserved a red and a green boat

- **Previous approach won't work! Must identify sailors who've reserved red boats, sailors who've reserved green boats, then find the intersection (note that *sid* is a key for Sailors):**

$$\rho \text{ (Tempred, } \pi_{sid}((\sigma_{color='red'} Boats) \bowtie Reserves))$$

$$\rho \text{ (Tempgreen, } \pi_{sid}((\sigma_{color='green'} Boats) \bowtie Reserves))$$

$$\pi_{sname}((Tempred \cap Tempgreen) \bowtie Sailors)$$

Find the names of sailors who've reserved all boats

- **Uses division; schemas of the input relations to / must be carefully chosen:**

$$\rho \text{ (} Temp\text{sids, } (\pi_{sid,bid} Reserves) / (\pi_{bid} Boats) \text{)}$$

$$\pi_{sname} (Temp\text{sids} \bowtie Sailors)$$

- ❖ To find sailors who've reserved all 'Interlake' boats:

$$\dots / \pi_{bid} (\sigma_{bname='Interlake'} Boats)$$
